

The **Valtech Cockpit** is a collaborative platform for agile software development that unites stakeholders, project managers and developers across the globe.

The end of "black box" development

Tired of wasting precious time deciding on tools, environments, websites, formats and processes every time you start a new project? Cockpit lets you ramp up software development faster by providing a collection of ready-to-use management and communication tools. From day one you are free to concentrate your energies on defining the first product release, even if all the requirements are not fully validated.

Manage requirements with **agility**

1.

Valtech Cockpit's Requirements Management facility makes it easy to manage the scope of a project while taking into account evolving business priorities. Valtech Cockpit constantly updates dashboards to provide managers and developers with an instant overview of their progress. At any point in time it allows you to run simulations to confirm or challenge your delivery deadline.

★ Requirements management

- Manage Features
- Elaborate Features into Software Requirements
- Create tasks to complete Software Requirements
- Attach documents to Features and Software Requirements

★ Agile Planner

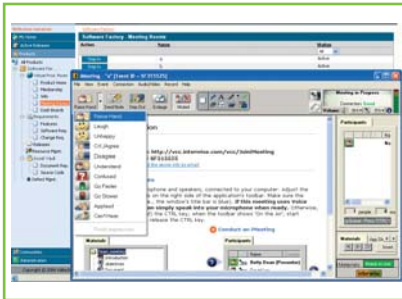

- Create Releases
- Assign Features to Releases
- Manage Iterations
- Update Tasks
- Display Dashboards

Boost productivity with real-time communication

Communication is the key to securing the success of your IT project. The difficulty lies with the distributed nature of today's global delivery projects, with distributed development teams and stakeholders.

2.

With the Valtech Cockpit team members can collaborate and share ideas in virtual project rooms, whether they're located side by side or around the world. Designed to ensure the shortest possible time-to-production, the Distributed Asset Vault provides a secure centralized repository for accessing and published shared resources, in particular project source code with robust version control functions.

★ *Virtual Project Room*

- Product Website with Wiki
- Project Membership
- Web Conferencing
- VOIP

★ *Distributed Asset Vault*

- Source Code Repository
- Document Management
- Version Control

3.

Take change in stride

As a project moves forward, change management and defect management become just as important as the software requirements themselves. To cope with change, it is often necessary to modify team size and composition on the fly.

The Valtech Cockpit provides a range of tools for allocating and managing human and technical resources. It also enables project and program managers to keep tight control over defects and change requests without disorganizing the project.

★ Resourcing

- Planning
- Tracking
- Team management

☀ Change Management

- Create and maintain change requests
- Manage change request implementation
- Track change requests from creation through to delivery

★ Defect Management

- Create and maintain defect lists
- Manage defect resolution through a defined process
- Capture management metrics regarding defects

Technology

The Valtech Cockpit is built on the following technologies:

- J2EE
- Struts
- Spring
- Wiki
- CVS
- Postgres

Availability and Support

The Valtech Cockpit is available with the following support:

- Troubleshooter
- Announcement subscription
- Knowledge base
- Support tickets

Future Releases

The following functionalities are planned for future releases:

- Ajax interface
- Estimation
- Third party integration support
- Advanced Data import and export
